	Interface responds	2E 3B hi lo 01 (	00 00 CRC		param:	hi lo = start address
'		<u> </u>		-	Rem:	nn = 0 means: read 256 bytes
					Rem:	Writes are internally verified with SilC2 only.

Com	mand Table	HexVal	DecVal	Ascii	Meaning
	_DeviceC2CK_LOW PC sends: Interface responds	3C 2F 3C 00 00 2E 3C 00 00	60 01 On CRC 01 On 00 CRC	<	Set Silabs C2 clock line (C2CK) to low param: 00-07 select the ESC channel (MULTIPLE ESC interfaces only) param: 00-07 Rem: valid for SilC2 only
	DeviceReadEEprom PC sends: Interface responds	3D 2F 3D hi lo ( 2E 3D hi lo r	61 01 nn CRC on bbb 00 CRC	=	Read EEprom of Target Atmel MCU  param: hi lo = start address; nn = number of bytes to read  param: hi lo = start address; nn = number of data bytes; bbb = data bytes  Rem: valid for Atm only. nn = 0 means: read 256 bytes
	DeviceWriteEEprom PC sends: Interface responds		62 on bbb CRC of 00 00 CRC	>	Write to EEprom of Target Atmel MCU param: hi lo = start address; nn = number of data bytes; bbb = data bytes param: hi lo = start address Rem: valid for Atm only. nn = 0 means: read 256 bytes
	InterfaceSetMode PC sends: Interface responds	3F 2F 3F 00 00 2E 3F 00 00	63 01 On CRC 01 On 00 CRC	?	Set interface mode param: 00-03 //SilC2=0, SiLBLB=1 ,AtmBLB=2, AtmSK=3 param: 00-03 Rem: valid full 4w-if interfaces only // respond ACK_OK or ACK_I_INVALID_PARAM

Connect to the interfaces is generally done with 8N1 38400 baud and no flow control.

At start send some 0xFF bytes (BLHeliSuite sends 4) to check, if the connection to the interface is 1 or 2 wire and set the Box from menu to "listen" state. Sending 3 or more "0x00" bytes will activate the watchdog of the interfaces and reset (activate bootloader).

#### **Errror codes**

If a command sequence is send by the master and the interface fails to proceed, it will answer with an Error code.

Interface Error Response 2E cc hi lo 01 00 er CRC Data: 00 cc = command which failed; hi+lo = address value which failed; er = Error Code

#### **Error codes defined for ACK**

ACK_OK	0x00	Operation succeeded. No Error.	
ACK_I_UNKNOWN_ERROR	0x01	Failure in the interface for unknown reason	unused
ACK_I_INVALID_CMD	0x02	Interface recognized an unknown command	
ACK_I_INVALID_CRC	0x03	Interface calculated a different CRC / data transmission form Master failed	
ACK_I_VERIFY_ERROR	0x04	Interface did a successful write operation over C2, but the read back data did not match	
ACK_D_INVALID_COMMAND	0x05	Device communication failed and the Status was 0x00 instead of 0x0D	unused
ACK_D_COMMAND_FAILED	0x06	Device communication failed and the Status was 0x02 or 0x03 instead of 0x0D	unused
ACK_D_UNKNOWN_ERROR	0x07	Device communication failed and the Status was of unknow value instead of 0x0D	unused
ACK_I_INVALID_CHANNEL	80x0	Interface recognized: unavailable ESC Port/Pin is adressed in Multi ESC Mode	
ACK_I_INVALID_PARAM	0x09	Interface recognized an invalid Parameter	
ACK_D_GENERAL_ERROR	0x0F	Device communication failed for unknown reason	

#### **History:**

```
V1.0 Intial release
```

V2.0 Added Support für Multiple BESC Handling

Interface Name starting with "m..." indicates: this is a multiple BESC Interface

The following Commands got a new parameter 0-7 which selects the BESC Channel 1..8

Once selected, the Channel will remain activ till another one is selected.

cmd DeviceC2CK LOW

cmd DeviceReset

cmd\_DeviceInitFlash

To enable Interfaces with less than 8 channels ACK\_I\_INVALID\_CHANNEL is added Interface will respond if a Channel higher than supported is addressed.

- V3.0 cmd DeviceInitFlash returns the SiLabs device Derivative ID
- V4.0 cmd\_DeviceInitFlash combines cmd\_DeviceReset + cmd\_DeviceGetID + cmd\_DeviceInitFlash and returns DeviceID, DerivativeID and LineState for C2D and C2CK wires
- V5.0 cmd\_InterfaceGetVersion now returns 2 bytes.

(first byte = 2 digit main+ 1.digit sub / second byte 3. and 4. digit sub)

Length of cmd InterfaceGetVersionStr is no longer fixed to 12 but variable length

V105 First Rev of 4way Interface (4w-if); Some Changes in Names

New Error Code ACK I INVALID PARAM

V6/106 removed cmd DeviceGetID

Internal Verify now for C2 removed / please use DeviceRead to verfiy

Fixed ACK\_D\_GENERAL\_ERROR =0x0F onf 0xFF

Added new commands cmd\_DeviceReadEEprom,cmd\_DeviceWriteEEprom, cmd\_InterfaceSetMode Autodetect mode added for v106. Interface switches between BLHeli and SK bootloader Atmel/Silabs.
